3. For the approver: step by step
4. Worked example: change the conquest first reminder timing
5. JSON Logic cheat sheet
6. Troubleshooting

Document	Version	Date	Owner	Status
Rule Author and Rule Approver Manual	1.0	07 October 2026	iorta TechNXT — Business Analysis and UX	Issued for submission

Rule author (maker)		Rule approver (checker)
Role	rule_author	rule_approver (also compliance_officer)
Demo user	author	approver (MFA), compliance (MFA)
Permissions	rules:read, rules:author, dashboard:read	rules:read, rules:approve, audit:read, dashboard:read
Can	Create drafts, validate, simulate, submit own drafts, create rollback drafts	Simulate, approve or reject drafts submitted by someone else , read the audit trail
Cannot	Approve or reject	Create or submit drafts

The platform enforces **four-eyes** control. Only the author can submit a draft, and the person who created a draft **can never approve or reject it** ("Maker-checker: you cannot approve your own change"). In addition, the roles `rule_author` and `rule_approver` (or `compliance_officer`) cannot be held by the same person: the platform refuses that combination.

Read the [Staff User Manual](#) first.

1. What rules control

All business behaviour is held in **versioned rule sets**. Each **kind** has exactly one **active** version at a time.

Kind	Controls	Typical approver
products	Product catalogue, channels where each product is sold, bundles	Product + Compliance
tariff.tnds_car, tariff.tnds_motorbike	Regulated TNDs premiums (Decree 67/2023/ND-CP)	Underwriting + Compliance
rating.motor_pd, rating.pa_seat	Voluntary product rates (currently illustrative , to be replaced with filed rates)	Underwriting / Actuarial
commission	Partner commission by product and partner type, with statutory caps	Finance + Compliance officer (enforced)
scoring	Lead score factors, weights, tier thresholds (hot ≥ 70, warm ≥ 45)	Product / Data
nba	Next-best-action decision table	Product
journeys	Journeys, audiences, step timings and channels, cross-sell	Marketing + Compliance
triggers	Ecosystem-event moments of truth	Marketing + Compliance
content.messages	Customer message templates (vi/en)	Compliance (and Zalo template approval)
content.voicebot	Voice bot script, disclosure and intent keywords	Compliance
benefits	Value-beyond-discount catalogue, eligibility, relevance, legalStatus	Legal / Compliance

Kind	Controls	Typical approver
copy_guard	Banned phrases for customer copy	Compliance officer (enforced)
contact_policy	Contact hours, frequency caps, consent requirements	Legal + Compliance officer (enforced)
referral	Referral programme (disabled pending legal review)	Legal
enrichment	Source trust, expiry evidence weights, vehicle category inference	Data owner
retention	Data retention periods and actions	DPO + Compliance officer (enforced)
abac	Attribute-based access policies (regional data, own handoffs)	Security + Compliance officer (enforced)
costs	Unit costs for the economics dashboard	Finance
service_levels	Quote validity (24 h), claim acknowledgement SLA (4 h), confidence given to customer-declared, steward-corrected and bot-reported expiry dates	Product + Operations

The platform enforces two checks: the approver holds `rules:approve` and is not the author, and the **restricted kinds** (`abac`, `copy_guard`, `contact_policy`, `commission`, `retention`) are approved only by a **compliance officer** ("changes must be approved by: compliance_officer"). For all other kinds, your organisation's **approval matrix** above decides who may approve, and approvers must follow it.

Lifecycle

- A version's ID is `<kind>@<version>`, for example `scoring@3`.
- Approval takes effect on all servers within about **15 seconds**.
- **Rollback** never reactivates an old version directly. It creates a **new draft** with the old content, which goes through approval again.

2. For the rule author: step by step

Step 1 — Find the current version

1. Open **Rules studio**.
2. In the list of rule sets, find the kind (for example `scoring`). The active version has the status **active**.
3. Open it to see the description, checksum, author, approver, activation date and the payload (JSON).

Step 2 — Create a draft

1. From the active version, edit the payload in the JSON editor. For example, raise the hot threshold:

```
"tiers": { "hot": 75, "warm": 45 }
```

2. Fill **Description** with the business reason and expected impact, for example "Raise hot threshold to 75 to focus voice bot capacity; expected -15 % hot volume."

Step 3 — Validate

1. Select **Validate**.
2. **What you will see:** "Valid", or a list of errors with JSON paths, for example:
 - `$.factors[2].value: unsupported operator "clamp"` : a typo in a JSON Logic expression.
 - `rule tnds_any: rate 0.08 exceeds statutory cap 0.05 for TND CAR` : commission above the legal cap.
 - `copy guard: "giảm giá" in "Giảm giá 10% khi gia hạn..."` : banned wording in customer copy.
3. Fix and validate again until valid.

Step 4 — Simulate (scoring, NBA, journeys, benefits)

1. Select **Simulate against a customer**.
2. Enter a customer ID (the plate key, for example `30A12345`) and select **Run simulation**.
3. **What you will see:** **Current** vs **Candidate** side by side: score and reasons, tier, journey, next best action and benefits.
4. Repeat on **at least five representative customers**: hot and warm, TASCO and conquest, lapsed, low-confidence expiry, company-owned. Note the results in the description or your change ticket.

Simulation is a dry run. It changes nothing.

Step 5 — Save as a draft

1. Select **Save as new draft**.
2. **What you will see:** a new version `<kind>@<n>` with status **draft**. The payload is validated again on save. An invalid payload cannot be saved.

Step 6 — Submit for approval

1. Open your draft and select **Submit for approval**.
2. **What you will see:** status **pending_approval** ("Submitted for approval"). Tell your approver, or rely on the Pending list they check daily.

Only the author of a draft can submit it.

Step 7 — After approval

- Check that the version shows **active** and the previous one **retired**.
- For scoring, NBA, journeys or benefits changes, ask the campaign manager for a lead recompute (or wait for the nightly `recompute` job).
- Monitor the expected effect for 7 days.

Rolling back

1. Open the earlier version you want to restore (status **retired**).
2. Select **Roll back to this version**. A **new draft** is created with that content, described "Rollback to `<id>`".
3. Submit it for approval as usual. For urgent rollbacks, call your approver.

3. For the approver: step by step

Step 1 — Find pending changes

1. Sign in (MFA required).
2. Open **Rules studio**. A banner lists the changes awaiting approval. Select one to open it.

Step 2 — Review

For each pending version:

1. Read the **Description**: is the business reason clear?
2. Compare it with the active version (**This version** vs active payload). Check exactly what changed.
3. Check that it is **within your approval authority** (see the table in section 1). Restricted kinds need a compliance officer.
4. Run your own **Simulation** on a few customers (scoring, NBA, journeys, benefits).
5. For customer-facing content, read the Vietnamese text in full:
 - no discount, rebate or cashback wording, and nothing that implies a lower price;
 - no promise of loyalty points or rewards unless the related benefit's `legalStatus` is `approved`;
 - truthful and clear; the voice bot keeps its disclosure ("trợ lý tự động"), recording notice and the "never asks for OTP or payment" line.
6. For `benefits`: items moving to `legalStatus: "approved"` must have a legal sign-off reference.
7. For `contact_policy`: values must not loosen consent or caps without a Legal decision.
8. For tariffs and rates: figures must match the regulation or filed rates.

Step 3 — Decide

- **Approve**: enter a **Review comment** (for example "Approved per ticket CHG-1234; simulation reviewed on 5 customers"), select **Approve** and confirm "Approve and activate?". The version becomes **active** and the previous one **retired**, in a single transaction.
- **Reject**: enter the reason and select **Reject**. The version becomes **rejected**. The author must create a new draft.

What you will see: a confirmation, and an audit entry (`rules.approved` or `rules.rejected`) with your comment and the superseded version.

Approval SLA (proposed): within 1 business day. Urgent rollbacks within 1 hour.

4. Worked example: change the conquest first reminder timing

1. **Author** opens `journeys`, finds the journey `conquest` and changes the `first_reminder` step `offset` from `-30` to `-35`.
2. **Validate**: valid.
3. **Simulate** with kind `journeys` on a conquest customer whose expiry is in 33 days. Current: no first reminder due yet. Candidate: first reminder due now.
4. **Save as new draft** (`journeys@2`) with the description "Conquest first reminder D-35 to land before competitors' D-30 calls".
5. **Submit for approval**.

6. **Approver** (Compliance) checks that the cap of 3 marketing contacts per week is still respected, simulates, and approves with a comment.
7. The campaign manager requests a lead recompute so that schedules are rebuilt for affected vehicles.

5. JSON Logic cheat sheet

Rules use JSON Logic expressions over customer facts.

Need	Expression
Field value	<code>{ "var": "days" }</code>
Compare	<code>{ "≤": [{ "var": "days" }, 14] }</code>
And / or / not	<code>{ "and": [...], { "or": [...] }, { "!": [...] }</code>
In list	<code>{ "in": [{ "var": "category" }, ["car_under6", "car_6_11"]] }</code>
If / else chain	<code>{ "if": [cond1, value1, cond2, value2, default] }</code>
Arithmetic	<code>{ "+": [a, b] }, { "/": [a, b] }, { "*": [a, b] }</code>
Clamp to a range	<code>{ "clamp": [expr, 0, 1] }</code>
Text	<code>{ "cat": ["expires in ", { "var": "days" }, " days"] }</code>
Round	<code>{ "round": [expr] }</code>
Min / max	<code>{ "min": [a, b] }, { "max": [a, b] }</code>

Common facts: `days` (days to expiry, negative means lapsed), `expiryConfidence` (0–1), `insurer`, `tier`, `score`, `consent.marketing`, `consent.call`, `consent.dnc`, `channels.app_push`, `channels.zalo_zns`, `channels.sms`, `channels.voice_bot`, `hasPhone`, `ownerType`, `category`, `seats`, `vehicleAge`, `appSessions30d`, `tollTrips30d`, `longTripsKm90d`, `walletBalance`, `autoTopUp`, `premium`, `tagAgeDays`, `journey`.

Decision tables (`nba`, commission, rate tables, category inference) use **hit policy "first"**: rules are evaluated top to bottom and the first match wins, otherwise `default` applies. **Order matters.**

6. Troubleshooting

Message	Meaning	Fix
"Rule set is invalid" + list	Validation errors	Fix each path shown
"Only the author can submit a draft"	You are not the creator	Ask the author
"Only drafts can be submitted (status: ...)"	Already submitted, approved or rejected	Create a new draft
"Maker-checker: you cannot approve your own change"	You authored it	Another approver must decide
"Only pending rule sets can be approved (status: ...)"	Not submitted, or already decided	Refresh. Check the status.
" changes must be approved by: compliance_officer"	Restricted kind	Ask a compliance officer to approve
"Missing permission rules:author"	Approver accounts cannot draft	Ask an author

Message	Meaning	Fix
Change not visible after approval	Cache refresh (up to 15 seconds), or leads not recomputed	Wait. Ask for a lead recompute.
